Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (EtxB and CtxB) facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibit of for toxin-induced diarrhoea.
                                             Derivatives of Escherichia coli heat labile enterotoxins useful as immunomodulators and for treating diarrhea and which do not bind tiglycolipid receptor {\tt GM-1} -
                                                                                                                                                      Williams NA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The invention relates to peptide fragments of the Escherichia coli heat CC labile enterotoxin (Etx) and its closely related homologue, cholera CC toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are CC composed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and CC cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the effects of Etx and Ctx, it has been found that certain CC effects of the toxins, such as immunomodulation, are not mediated CC through GM-1 binding. The peptides of the invention (AXM87461-Y87463) are CC same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may be used as an inhibitor for CC toxin-induced diarrhoea. Therefore, the peptides may be used in the CC production of a composition for treating, preventing and/or modulating a CC diarrhoea. Sequences AXM87464-Y87465 represent peptides used in an CC examplification of the present invention to assess whether a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 represent preferred peptides of the invention, AAY87460 being
                                                                                                                                                                                                                                                                                                                                                                                                                        W08,91.0967A
This sequence corresponds to the CTP3 epitope of the Cholera toxin subunit. The DNA sequence encoding this ligates to othersynthetic oligonuclectides to form a new recombinant gene. This encodes a flagellin fusion protein which can be used in vaccines for immunc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit

                                                                                                                                                 Ş
                                                                                                                                                                                                                                                     is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-
Cribosyltransferase activity, while the B subunits (EtxB and CtxB)
Cfacilitate the entry of subunit A into the host cell via the binding and
Ccross-linking of GM-1 receptors. Although GM-1 binding is responsible
Cfor some of the effects of Etx and Ctx, it has been found that certain
Cffects of the toxins, such as immunomodulation, are not mediated
Cthrough GM-1 binding. The peptides of the invention are fragments of the
Deta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as
Cnormal EtxB and CtxB subunits, except that they do not bind or cross link
CGM-1. They may be used in medicine as an immunomodulator or adjuvant.
They may also be used as an inhibitor for toxin-induced diarrhoea.

                                                                                                                                                                            밁
                                                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                                                       effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (EtxB and CtxB)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Derivatives of Escherichia coli heat labile enterotoxins useful as immunomodulators and for treating diarrhea and which do not bind the glycolipid receptor {\tt GM-1} -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Heat labile enterotoxin subunit B; EtxB; beta-4-alpha-2 loop; GM-1 ganglioside receptor; immunomodulation; adjuvant; immune disorder; diarrhoea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain
                                                                AAR76748

                                                                                             밁
                                                                                                                 ρy
                                                                                                                                                                                                       This sequence is encoded by a fragment of the the plasmid pLPA93

C which was used in the production of finh fusion genes comprising

C the cholera toxin B subunit inserted into the finH gene. This insert

C shows the inclusion of the B subunit into the FinH protein at position

C 24-226. The chimeric genes were then opt. further modified by insertion

C of the hepatitis B virus surface antigen pre-S2 region into a different

C position of the FinH adhesin of type I fimbriae. Restiction site handles

C (BgIII-sites) were introduced into the finH gene, and the foreign

C epitopes are then inserted in-frame. In the selected positions the

C insertion of the epitopes did not significantly alter the adhesive

C function of the FinH protein. The expression of the chimeric proteins

C on the surface of fimbriae on bacterial hosts illustrated the possibility

C of using bacterial adhesins as general presenters of foreign antigens and

C pitopes. These chimeric genes may be used in the production of variant

C rimH adhesins which may be useful for targetting active compounds

C and microbial cells to locations comprising selected receptors to which

Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coll (enterotoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as

This polypeptide may be used in the vaccination of mammals for protection against the enterotoxins. The composite polypeptide is made by solid phase synthesis or recombinant DNA techniques. X9 is Met or Lys, X12 is Ala or Glu, X39 is Asn or Tyr and X46 is Tyr or Asn. See also AAP50439-57.

                                                                                                          The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterotoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as

                                                                                                                                                                                                                            AAR72540-R72545 are structurally equivalent B-subunits from three ADP-ribosylating toxins, pertussis holotoxin (PT), E. coli heat labile toxin (LT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to PT's biological activity. By modifying these sites the claimed PT mutants of the invention were produced,

holotoxin, functional (au) .....holotoxin, functional (au) holotoxin, functional (au) holotoxin, functional to pertussis holotoxin can be identified. This can be pertussed by the toxicity of the holotoxin to produce immunoprotective, genetically-detoxified analogues of pertussis holotoxin. The present sequence represents an ADP-ribosylating holotoxin. The present sequence represents an ADP-ribosylating the present besubunit peptide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 22-AUG-1994;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     operon; and (3) expressing mutant tox box in a Bordetella organism to produce the modified holotoxin. This method is used for modifying pertussis holotoxin, by studying its 3-dimensional crystalline structure. Modifying the holotoxin, alters its biological properties. By analysing the 3-dimensional crystalline structure of the pertussis holotoxin, functional (aa) which affect biological properties of the pertussis holotoxin can be identified. This can be used to predict (aa)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method has been developed of producing a modified pertussis holotoxin, involving analysis of the 3-dimensional form of the crystalline holotoxin. The pertussis holotoxin modification process comprises:
(1) identification of at least one amino acid (aa) residue of the holotoxin for modification by analysing the 3-dimensional form of the

                                                                                                  δÃ
                                                                                                                                                                                                             The invention relates to methods of preparing a pertussis holotoxin (PT) CC having a modified biological activity. One method comprises identifying CC at least 1 site in a PT that interacts with a molecule that is capable of CC forming a complex with the holotoxin and which molecule is an effector CC molecule which is an adenine nucleotide and which site contributes to CC toxicity, cell binding or enzymatic activity of PT. The functional interacting site(s) are identified by analysing the three dimensional CC structure of crystalline PT, determined by X-ray crystallogaphy. The CC identified interacting site(s) are modified to alter toxicity, cell binding or enzyme activity of the PT. The methods can be used to alter a CC biological activity such as toxicity, enzymatic activity, mitogenicity, cell binding and adjuvanticity of the PT. The three-dimensional structure CC of PT have functional and/or structural resemblance to other bacterial CC toxins such as diphtheria toxin (DT), Pseudomonas exotoxin A (ETA), the CC heat-labile toxin of E. coli (LT) and verotoxin-1. (VT). The present CC sequence represents the beta-subunit of LT toxin.
                                                                                                                                      Query Match

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                 Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            seq length:
